

BTI Breaching Window

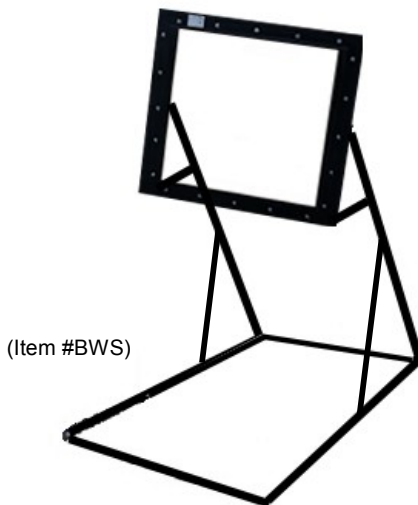

The **BTI Breaching Window** is designed to totally replicate an actual window breach down to the last shard of glass that must be raked for a clean entry. The window replicates a real window in which the molding would retain some of the glass even after it is broken. This requires that the trainee not only break the window glass, but also rake the window to get rid of all the remaining pieces of glass prior to entry. This patent pending design allows training at a fraction of the cost of using real windows.

The BTI Breaching window is designed to mount either inside or outside of the structure. Because the frame attaches flat to the structure, it doesn't have to line up exactly with the hole in the structure.

(Item #WIN)

The BTI Breaching Window will accept up to two sheets of 36" x 36" x 1/8" tempered or plate glass. This allows training on both single and double pane windows.

(Item #BWS)

The optional Breaching Window Stand makes it portable and allows the window to be placed and anchored as desired.
